## VII. CHEMICAL ANALYSES OF COMMUNITY WATER SYSTEMS

# CHEMICAL ANALYSES OF COMMUNITY WATER SYSTEMS

## INTRODUCTION

### KEY TO CODES

The chemical analyses of community water systems section contains data on inorganic chemical (IOC) test results. Under Missouri's Public Drinking Water Regulations (10 CSR 60-4), water systems are required to have samples collected and submitted to a certified drinking water laboratory for analyses. Water systems utilizing surface water sources are required to sample every year for IOC analyses while those utilizing groundwater sources are required to submit samples once every three years. Monitoring requirements for certain contaminants have been reduced to less often than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year and are considered representative. All active water sources are required to sample annually for nitrates. These analyses are performed by the Missouri Department of Natural Resources' Environmental Services Program or other certified drinking water laboratories. Results are given in this section for a group of common IOCs and the value provided represents the most recent sample for the chemical contaminant. If no result is listed, the water system has not been sampled for the specified chemical. This may be because the water system is newly activated, or the water system has recently been reclassified as a community water system and results were not available at the time of this report.

Below is a list of chemical contaminants included in this section. In parentheses behind some of the contaminants are suggested upper limits or regulatory maximums in milligrams per liter (mg/L) also known as parts per million or micrograms per liter (ug/L) also known as parts per billion. In addition to the listed chemicals, analyses were also completed for the following inorganic chemical contaminants: arsenic, barium, cadmium, chromium, lead, mercury, selenium, and thallium. The results of all chemical analyses are on file in the office of the Missouri Department of Natural Resources' Public Drinking Water Branch and can be viewed at <https://www.dnr.mo.gov/DWW/DNRLLogin.jsp>. Results that are below the detection limit are marked as not detected or "ND". The results in the following tables are listed in terms of either mg/L, ug/L, or in the case of pH, standard units.

#### Milligrams per Liter (mg/L)

Alk – Alkalinity (as CaCO <sub>3</sub> )	Na - Sodium
Ca – Calcium	NO <sub>3</sub> – Nitrate (10)
Cl – Chloride (250)	SO <sub>4</sub> – Sulfate (250)
F – Fluoride (2.0 & 4.0)	TDS – Total Dissolved Solids (500)
K - Potassium	TH – Total Hardness
Mg - Magnesium	

#### Micrograms per Liter (ug/L)

Al – Aluminum (50-200)
Cu – Copper (1,000)
Fe – Iron (300)
Mn – Manganese (50)
